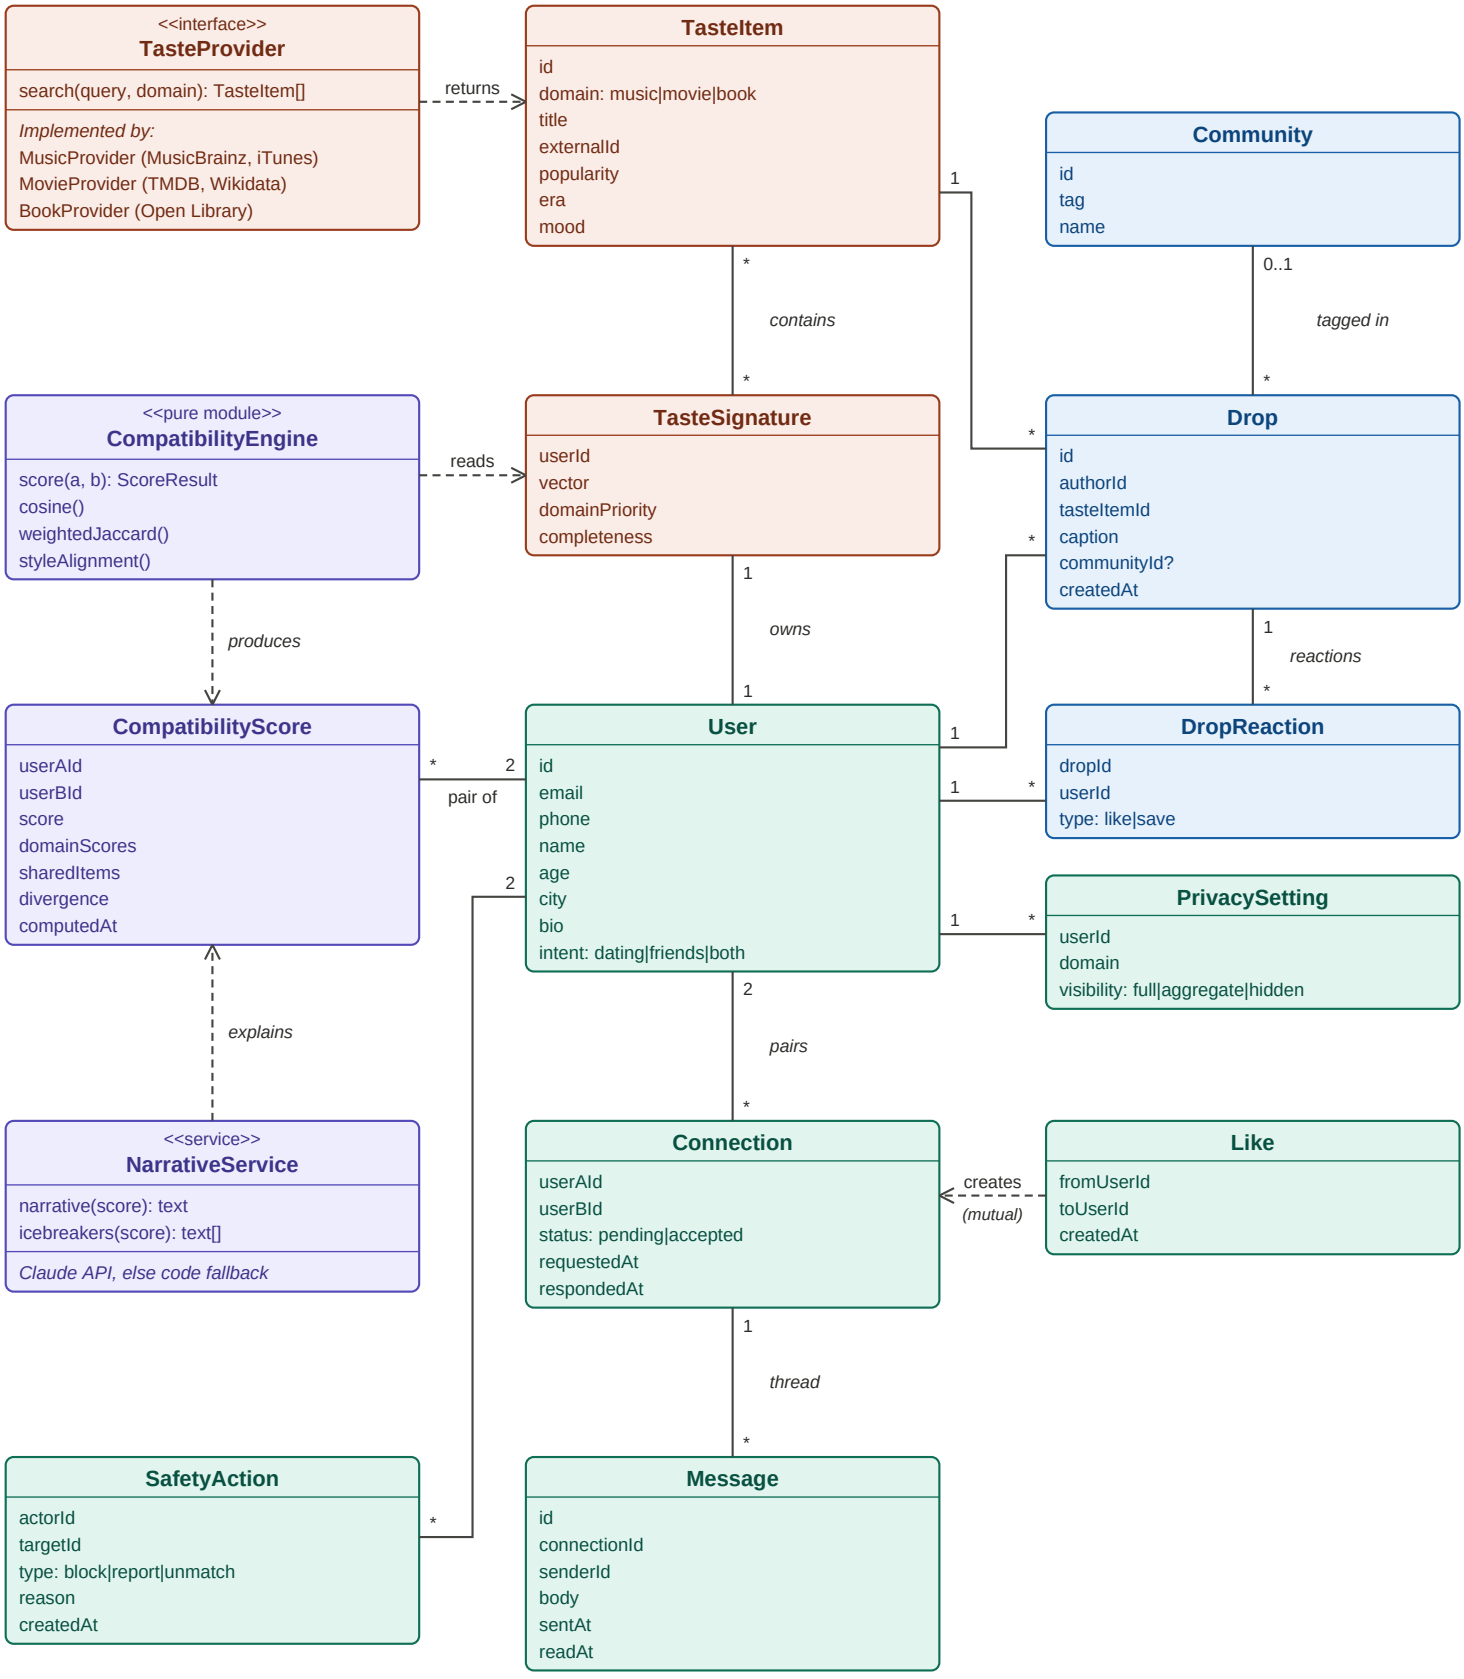
MATES - Class diagram

Domain model and key services of the MATES backend



Dashed arrow = dependency (uses or creates). Plain line = association with multiplicities. Foreign keys are shown as attributes.
Connection and CompatibilityScore store each pair once, ordered so that userAId < userBId (database CHECK constraint).
Community membership is a many-to-many join between User and Community (join and leave), not drawn as its own class.
Message.senderId and Like.fromUserId / toUserId also reference User; those links are omitted to keep the diagram readable.
Attribute lists are inferred from the project report and README. Check them against server/src/db/migrations/ before submitting.
